

Norfolk Mushrooms Information Pack

Introduction

Our chestnut and portabello mushrooms are grown by a farming collective based across Norfolk and Suffolk. Nutritionally, mushrooms are low carb and low calorie but packed full of nutrients including iron and potassium. They also contain high levels of B vitamins which are crucial to unlocking and releasing energy from your food.

A fact from our grower: 'White button mushrooms, creminis and portabello mushrooms are actually the same species but harvested at different levels of maturity, much like lamb, hoggart and mutton'

Farm Information

On a commercial scale, mushrooms are grown in large temperature and humidity controlled indoor spaces. The rising cost of energy and land has caused many mushroom growers in the UK to dissolve into insolvency, with imports arriving from countries such as Poland where these resources are cheaper. Smaller, family run mushroom farms were the hardest hit by rising costs, so collectives such as these are a lifeline to save these businesses.

This growing collective are a fantastic example of the power of collectives in the agricultural sector, pooling resources and centralising branding in a bid to survive and out compete imports. Nutritionally, mushrooms are low carb and low calorie but packed full of nutrients including iron and potassium. They also contain high levels of B vitamins which are crucial to unlocking and releasing energy from your food.
