

Nutbourne Tomatoes Information Pack

Introduction

When it comes to glasshouse grown vine tomatoes, Garry and Jenny at Nutbourne Tomatoes are the experts. We are lucky enough to have them on our doorstep in West Sussex and have worked closely with the grower to spread these amazing tomatoes across our network of chefs. They are constantly refining their technique and exploring new varieties, a fantastic and innovative local grower that we are incredibly proud to support.

Farm Information

The only way to really grow a commercially viable crop of tomatoes in the UK is using a glasshouse. This creates a controlled environment that is manipulated by the grower to produce the optimum conditions for flavour and yield.

Temperature, humidity and CO2 level are tightly controlled in the glasshouse, while larger wind-borne pests can be excluded from the crop entirely. To control smaller pests, the Nutbourne team employs an integrated pest management system (introduce 'good' insects that eat the 'bad' insects) this enables them to grow tomatoes without the use of synthetic chemical pesticides that are often found in huge residues on other tomato crops.

The season spans from March until October, generating the entire farm income for the year in this time. This crop is highly sort after by chefs, so we encourage forecasting with this grower to ensure supply.
