

Cavolo Nero Information Pack - General

Your Cavolo Nero is from [Hurst Farm](#) in Surrey. The crop is hand picked early every morning **by Greg and the team** to retain freshness. Their fields are a mere 3 miles from Chef's Farms HQ. The soil here is sandy loam, perfect for cropping vegetables. This soil supports a diverse vegetable crop rotation, many of which also feature on your menus.

Cavolo Nero is in the brassica family, alongside broccoli and cabbage. It is an incredibly hardy, frost-resistant crop so can be grown all year round on British farms due to our temperate climate.

We are now into the winter crop of brassicas; the plants go into a kind of dormant state and can be continually harvested throughout the colder months. In traditional market gardening brassicas are the winter food that also serve the purpose of keeping the soil covered over winter, which is vital to ensure soil nutrients and carbon are not washed away during the more extreme rainfall at this time of year.

On this farm, Cavolo is grown in strips alongside other vegetables to mitigate pest pressure from pigeons (hence the nets) and the cabbage white butterfly, whose caterpillars can strip the crop bare.

Cavolo is very high in vitamin K alongside A and C as well as being a strong source of Calcium, Iron and Magnesium. Its calcium content is especially useful for someone who doesn't eat dairy, as this nutrient can be hard to come by elsewhere, especially in vegan diets. Videos available upon request. Farm visit 17/11/25
