

Celeriac Information Pack

Introduction

Celeriac is a cultivar variant of the same plant that gives us celery. It is in the carrot and parsley family (called Apiaceae) that is characterised by a peppery taste. Ensuring a year round supply of celeriac from the UK is a similar story to carrots, requiring multiple planting dates of multiple varieties across multiple latitudes.

Farm information

Our celeriac growers work on a collective, across multiple farms to maintain supply consistency. In March, we are on the Lincolnshire crop, we will move further north until we get back to new season later in the summer. All our growers work with diverse crop rotations to ensure the health of the soil is protected. Large root crops like celeriac are especially impactful as the soil is disturbed during harvest and cultivation. In order to mitigate against this, cover crops and different crop type always follow a celeriac harvest to rebuild soil health.

More

Nutritionally, celeriac stands out for its vitamin and mineral content: it is packed full of vitamin K, contributing to normal blood clotting and bone health, and provides vitamin C for immune function. It also contains potassium, phosphorus, calcium and magnesium, which support muscle function, bone strength and overall metabolic health.
